| KKT A4 | AISI316

CE

CONE-SHAPED CONCEALED HEAD SCREW

AGGRESSIVE ENVIRONMENTS

A4 | AISI316 stainless steel version ideal for very aggressive environments, for acidic, chemically treated wood and very high internal moisture (T5). KKT X version with short length and long bit for use with clips.

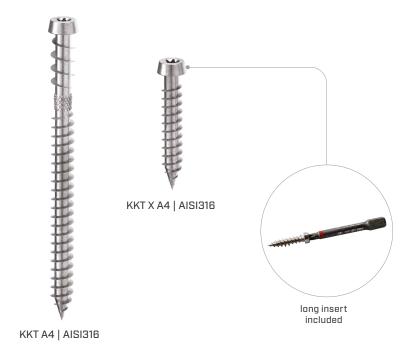

COUNTER THREAD

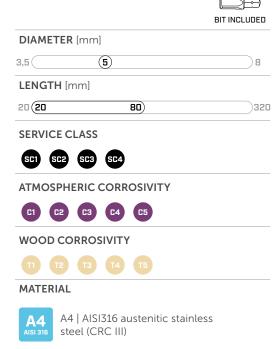

The inverse (left-hand) under-head thread guarantees excellent grip. Small conical head to ensure it is hidden in the timber.

TRIANGULAR BODY

The three-lobed thread makes it possible to cut the wood grain during screwing. Exceptional timber pull-through.

FIELDS OF USE

Outdoor use in highly aggressive environments. Wooden boards with density of $< 550 \text{ kg/m}^3$ (without pre-drill) and $< 880 \text{ kg/m}^3$ (with pre-drill). WPC boards (with pre-drill).

■ GEOMETRY AND MECHANICAL CHARACTERISTICS

GEOMETRY

| Nominal diameter | d_1 | [mm] | 5,1 |
|---|-------|------|-----------|
| Head diameter | d_K | [mm] | 6,75 |
| Thread diameter | d_2 | [mm] | 3,40 |
| Shank diameter | d_S | [mm] | 4,05 |
| Pre-drilling hole diameter ⁽¹⁾ | d_V | [mm] | 3,0 - 4,0 |

 $^{^{(1)}}$ For high density materials, pre-drilled holes are recommended based on the wood specie.

CHARACTERISTIC MECHANICAL PARAMETERS

| Nominal diameter | d_1 | [mm] | 5,1 |
|---------------------------------|---------------------|----------------------|------|
| Tensile strength | $f_{tens,k}$ | [kN] | 7,8 |
| Yield moment | $M_{y,k}$ | [Nm] | 5,8 |
| Withdrawal resistance parameter | f _{ax,k} | [N/mm ²] | 13,7 |
| Associated density | ρ_a | [kg/m ³] | 350 |
| Head-pull-through parameter | f _{head,k} | [N/mm ²] | 23,8 |
| Associated density | ρ_{a} | [kg/m ³] | 350 |

KKT X

Ideal for fastening standard Rothoblaas clips (TVM, TERRALOCK) in outdoor environments. Long bit included in each package.

MINIMUM DISTANCES FOR SHEAR LOADS

NOTES

- The minimum distances are according to EN 1995:2014 considering a calculation diameter of d = screw diameter.
- The minimum spacing for all steel-to-timber connections (a $_1$, a $_2$) can be multiplied by a coefficient of 0,7.
- The minimum spacing for all panel-to-timber connections (a1, a2) can be multiplied by a coefficient of 0,85.

 $[\]alpha$ = load-to-grain angle

GENERAL PRINCIPLES

- Characteristic values according to EN 1995:2014.
- Design values can be obtained from characteristic values as follows:

$$R_d = \frac{R_k \cdot K_{mod}}{V_{ii}}$$

The coefficients $\gamma_{\mbox{\scriptsize M}}$ and $k_{\mbox{\scriptsize mod}}$ should be taken according to the current regulations used for the calculation.

- Mechanical strength values and screw geometry comply with CE marking according to EN 14592.
- Dimensioning and verification of timber elements and steel plates must be carried out separately.
- The screws must be positioned in accordance with the minimum distances.
- The KKT A4 screws with double thread are mainly used for timber-to-timber joints.
- The KKT X total thread screws are mainly used for steel plates (e.g. TER-RALOCK patio system).

NOTES

- The axial thread withdrawal resistance was calculated considering a 90° angle between the grain and the connector and for a fixing length of b.
- The axial resistance to head pull-through was calculated using timber elements also considering the underhead thread.
- The characteristic shear strengths are evaluated considering the case of thin plate (S_{PLATE} \leq 0,5 d₁) and intermediate plate (0,5 d₁ < S_{PLATE} < d₁).
- In the case of steel-to-timber connections, generally the steel tensile strength is binding with respect to head separation or pull-through.
- For the calculation process a timber characteristic density ρ_k = 420 kg/m 3 has been considered.
